INVESTOR & MEDIA UPDATE

Novartis investigational oral therapy iptacopan (LNP023) receives FDA Breakthrough Therapy Designation for PNH and Rare Pediatric Disease Designation for C3G

- Paroxysmal nocturnal hemoglobinuria (PNH) is a rare and life-threatening blood disorder, resulting in debilitating symptoms that can impact patients’ quality of life1–3

- C3 glomerulopathy (C3G) is a rare renal disease, affecting young patients with a poor prognosis and significant unmet need4–5

- With potential to be the first oral treatment for a range of complement-driven diseases, complement factor B inhibitor iptacopan targets the underlying cause of these conditions through its action on the complement system’s alternative pathway6,7

- Iptacopan is in development for PNH, as well as C3G and several other rare renal diseases including IgA nephropathy (IgAN), atypical hemolytic uremic syndrome (aHUS), and membranous nephropathy (MN); first FDA filings anticipated in 2023

Basel, December 16, 2020 — Novartis today announced that the U.S. Food and Drug Administration (FDA) granted iptacopan (LNP023) Breakthrough Therapy Designation (BTD) in paroxysmal nocturnal hemoglobinuria (PNH) and Rare Pediatric Disease (RPD) Designation in C3 glomerulopathy (C3G).

The breakthrough designation is intended to expedite the development and review of medicines for serious conditions to address unmet medical need, where early clinical evidence indicates a drug may demonstrate substantial improvement over available therapy on clinically significant endpoints. The FDA granted BTD to iptacopan for the treatment of PNH based on positive interim results from two ongoing Phase II studies, where iptacopan showed substantial benefits both in patients who remained anemic and dependent on transfusions despite standard of care anti-complement treatment8, as well as monotherapy in anti-C5 naïve PNH patients.

PNH is a rare and life threatening blood disorder characterized by complement-driven hemolysis, thrombosis and impaired bone marrow function9,10, resulting in anemia, fatigue and other debilitating symptoms that can impact patients’ quality of life1–3. Despite current standard of care – anti-C5 therapy eculizumab or ravulizumab – a large proportion of PNH patients remain anemic and dependent on transfusions1,2,9,11,12.
FDA grants the rare pediatric designation for serious or life-threatening diseases primarily affecting individuals aged 18 years or younger and impacting fewer than 200,000 people. C3G, an ultra-rare and severe form of primary glomerulonephritis\(^4,13\), is characterized by complement dysregulation. It has a poor prognosis; about 50% of patients progress to end-stage renal disease (ESRD) within 10 years, and 50–70% experience disease recurrence post kidney transplant\(^14\). It has a worldwide annual incidence of 1-2 per million\(^15\).

**About iptacopan**

Iptacopan (LNP023) is a first-in-class, orally administered, potent and highly selective factor B inhibitor of the alternative complement pathway\(^6,7\). It is currently in clinical development for PNH, as well as C3G and a number of other renal conditions with complement system involvement where significant unmet needs exist, including IgA nephropathy (IgAN), atypical hemolytic uremic syndrome (aHUS), and membranous nephropathy (MN).

Positive Phase II data from one study in PNH were presented at the European Society for Blood and Marrow Transplantation (EBMT) congress in August\(^8\), and Phase II interim analysis results in C3G were presented at the virtual 2020 Annual Meeting of the American Society of Nephrology (ASN) in October. Novartis is planning to initiate Phase III studies in several indications.

Iptacopan has the potential to become the first complement pathway inhibitor to slow disease progression in a number of complement-driven diseases. Based on disease prevalence and the positive interim data from Phase II studies, iptacopan has also received orphan drug designations from the FDA and EMA in C3G and PNH\(^16\), as well as EMA PRIME designation for C3G\(^17\), and EMA orphan drug designation in IgAN\(^18\).

About Novartis
Novartis is reimagining medicine to improve and extend people’s lives. As a leading global medicines company, we use innovative science and digital technologies to create transformative treatments in areas of great medical need. In our quest to find new medicines, we consistently rank among the world’s top companies investing in research and development. Novartis products reach nearly 800 million people globally and we are finding innovative ways to expand access to our latest treatments. About 110,000 people of more than 140 nationalities work at Novartis around the world. Find out more at https://www.novartis.com.
